

The HPP Sustainable Model

Since 1997, HPP has diverted millions of tons of non-hazardous construction materials from Gulf Coast landfills. We recycle soils, sands, concrete and asphalt pavements into usable products for commercial development and highways.

2 Items are separated and processing begins.

1 Concrete, asphalt pavement, soils, sands and other acceptable materials are brought to HPP facilities.

3 Base courses, rip-rap, select fills and other products are produced.

4 The products go to roadway construction, commercial construction, infrastructure projects, environmental construction and other building activities.

5 Taxpayers, businesses and government projects save money by using recycled products.

6 Native resources are saved for future generations. The need for quarries and landfills is reduced.
